When you want to transfer a large size of files or folder from one location to another, then you need to use any good compression tool to facilitate the task. Many free tools are available to compress and decompress files and folders. One of them is the 7-Zip file filer. It is a file of open code files awarded with high compression relationship. This software supports the majority of popular and multiple operating systems file formats. You can use this to compress and decompress files and folders in 7Z, XZ, BZIP2, GZIP, TAR, ZIP and WIM formats. Some important characteristics of this tool are mentioned below. It provides a better compression relationship that is 2-10% better than other similar tools. Use a strong AES-256 encryption. It has automatic extraction capacity for 7Z file format. Support 87 languages in this tutorial, you will learn how you can install and use 7-zip file in the Ubuntu operating system. 7-Zip Installation: Update your operating system before executing the command to install 7-zip file. P7ZIP Package Contains 7-Zip. Two types of P7ZIP packages are available. These are P7ZIP and P7ZIP-FULL. If you want to make an extracted car also with other file options, then install P7ZIP-Full. The for P7ZIP-Full Package command is executed here. \$ SUDO APT-GET INSTALL P7ZIP-FULL Check that the package is installed correctly or not by means of the 7Z command. P7ZIP 16.02 Version is installed here that contains 7-zip 16.02. Using 7-Zip Select any file or folder to make the compression file using 7-zip. Type LS -l -The command to show the list of all files and folders of the current board. Here, the data.txt file is selected for compression. The file size is 540 bytes. Execute the command for Compressed file called Data. 7z. Option A is for file or compress. After the compression, the size of the file is 152 bytes. To display the data list of any file file, run the 7z command with the option L. Run Run command with option a to decompress or extract files and folder from a file file. By using previous steps you can create file from any folder as well. You can create file files and folders without using commands or terminals. Go to the file location, select the file and right-click it to open pop-up menu. Click the menu compression option to create file. Three file options are available in the dialog box that are .zip, tar.xz, 7z Here, .zip is selected to create a compressed file called myfile. The 7-zip zip file is an efficient tool to compress and decompress the required files and folder. You can easily transfer a lot of data using this file. p7 Zip is an open source tool for compressing files and folders on Linux and FreeBSD systems such as Ubuntu, Debian, RedHat and more. It is the best alternative to Winrar software that is intended for Windows platforms. Being an open code doesn't mean it's not available for Win systems. p7Zip is a 7Zip fork that is originally available for Windows. With the help of it, we not only compress, but can also decompress the files available in other formats like rar. This free compression tool offers many main functions such as AES-256, hyper-adjust and fast speed encryption. Apart from the graphic version, the 7Zip is also available on the command line suitable for servers or desktops that work without a desktop environment. p7Zip installation in Ubuntu 20.04 LTS Linux Here we will see the steps to install and use the 7Zip GUI in Ubuntu 20.04 LTS focal fossa to compress files and folders. The commands are also applicable for larger Ubuntu versions like 19.10/19.04/18.10/18.04 including Linux Menta. Step 1: Access CommandWell, if you are already a Ubuntu user then, I have no need to tell you how to access the command terminal. However, those who are new to Linux can open it by looking in ' I'm not in the world ' the the various available formats such as 7z, bzip2, gzip, tar, svim, xz, and zip. Compression level: Depending on how well compressed you want the archive, for that the level can be chosen. By default, it will be Normal. Compression method: It offers LZMA2, LZMA, PPMd, and BZip2. These are encoding methods if you know what are you doing then change it otherwise leave it as default. Several CPU threads: As the app supports hyperthreading, to process large files you can increase or decrease the assigned threads. Encryption: As I told above, the p7Zip offers encryption, thus, under eAAAEncryptioeAAA one can create a password for their compressed files. So, only they could open it. Finally, click on the OK button to start the compression process. Once it is done, the compressed file will appear on the software files explorer as well as on the location, where the original uncompressed file is located. Quick process to compress Apart from the p7ZIP GUI, it also integrates itself into the contextual menu of Ubuntu. It means you can directly archive files and folders without opening the software itself. For that, simply right-click on the file and select the eAAACompress.eAAA option. This will open a small quick window from which you can select the type of Archive format you want to use. Then simply hit the eAAACreateeAAA button. That's it. Decompression If already have an archive file then either right-click and select the decompress option or in the p7ZIP GUI file explorer select that file and click on the eAAAEExtracteAAA option given in the menu. p7Zip Command line to compress files Another quick method is for those who are familiar with the command line and prefer to use that only. For that the structure of the command to create archive files in the terminal will be: 7z - folder-name.7z folder-name Therefore, for example, if we say the folder name is eAAAPicsAAA then the command will be like this 7z a pics.7z pics To Any other file format uses that extension, for example, to obtain the file in ZIP format, the command will be: 7z a pics.zip pics here is the exit: I hope you now have an idea of using P7ZIP in Ubuntu 20.04 o Previous systems to create file files and folders. The Tar on Linux command is often used to create file files .tar.gz or .tgz, also called a e ostarballsA e. This command has a large number of options, but it has to remember some letters to create files with TAR. The TAR command can also extract the resulting files. The GNU TAR command included with Linux distributions has integrated compression. You can create a .tar file and then compress it with Gzip or Bzip2 compression in a single command. That is why the resulting file is a .tar.gz or .tar.bz2 file. Buy an entire directory or an unique file Use the following command to compress a complete directory or a single file in Linux. It will also compress each other directory within a directory that you specify a e " in other words, it works recursively. TAR -CZVF Name-die -archive.tar.gz/PathTo/Directory-O-File This is what those switches really mean: -C: Create a file. -Z: Buy the file with Gzip. -V: Show the progress in the terminal while creating the file, also known as a e everbosae e. The V is always optional in these commands, but it is a EtH. -F: Allows you to specify the file name. Let's say it has a directory called a e eestuffa e in the current directory and that you want to save it to a file called file.tar.gz. You would execute the following command: TAR -CZVF File. Tar.gz things, let's say there is a directory in/USR/local/something in the current system and want to compress it to a file called file.tar.gz. You would execute the following command: tar -czvf file.tar.gz Compress multiple directories or orep ,odipiAr s;Am se pizG. 2pizb arap j- nu noc Auqa sodnamoc sol ne pizg arap z- le ealpmee ofAs .olrecah arAP .sovihcra zbt. o .zb.rat .2zb.rat sodamall ondem a .2pizb sodimirpmoc sovihcra raerc etimrep el otsE .2pizb nAiserpmoc al atropos n eAibmat rat .zgt. sovihcra o zg .rat raerc arap aicneuecfer s;Am noc azilltu es pizg nAiserpmoc al eug sartneimI ragul us nE nAiserpmoc 2pizb esU 4pm.\*=edulcx- utnubu/emoh zg.rat.evihcra fvzc- rat :odnamoc etneugis le noc 4pm. sovihcra sol sodot riulcx e yotelpmoc oirotcerid nu ravihcra edeup .olpmeje roP .i eA noc recah sedepu euq s;Am ohcum yaH .senortap atpeca dadilaer ne a sovihcra y soirotercid ed serbmon amot oN .etemetop yum se edulcx- rotpurretni IE ehcac.utnubu/emoh/=edulcx- sdaoinwoD/utnubu/emoh/=edulcx- utnubu/ascac zg.rat.ovihcra fvzc- rat :saArah ol omoc se -AsA .ehcac.utnubu/emoh y sdaoinwoD/utnubu/emoh soirotercid sol rimirpmoc ereiug on orep .utnubu/emoh le rimirpmoc ereiug euq somagid .olpmeje roP .riulcx eeed euq ovihcra o oirotcerid adac arap edulcx- rotpurretni nu ed otsag le etnaidem olrecah edeup detsU .soirotercid y sovihcra sotreic riulcni on orep .otelpmoc oirotcerid nu rimirpmoc eeed euq elibisop se .sosc sonugla nE sovihcra y soirotercid riulcxE .radlaper sareiug omoc sovihcra o soirotercid sotnat atsil olAs .txt.seton/sotnemucoD/utnubu/emoh .futs/lacol/rsu sdaoinwoD/utnubu/emoh zg.rat.ovihcra fvzc- rat :odnamoc etneugis le ratuceje ed abaca detsU .txt.seton/stnemucoD/utnubu/emoh ovihcra le y .futs/lacol/rsu oirotcerid le sdaoinwoD/utnubu/emoh oirotcerid le rimirpmoc ereiug euq somagid .olpmeje roP .olos onu ed ratih ne soirotercid o sovihcra ed atsil anu anoirotcep olAs .sobma o selaudivdini sovihcra selpiHAm .soirotercid soirav rimirpmoc arap olrazilltu aArdop n eAibmat, oirotcerid olos nu rimirpmoc arap aicneuecferi noc azilltu es rat eug sartneimI rehas atiseceN sodnamoc 11 :xunil.lanimef al edsed sovihcra rartsinimda omAC :OXENOC zev anu Compress a little less, so you get a somewhat more big file. Bzip2 is but it compresses a little more, so you get a little smaller file. gzip is also more common, with some unmounted linux systems, including the default gzip support, but not the bzip2 support. In general, however, gzip and bzip2 are practically the same and both will work similarly. For example, instead of the first example we provide to compress the directory of things, the following command would be executed: tar -cjvf file.tar.bz2 things extract a file once you have a file, you can extract it with the tar command, the following command will extract the contents of the file. tar.gz to the current directory. tar -xvzf file.tar.gz is the same as the file creation command we heard earlier, except the switch -x replaces the switch -c, this specifies you want to extract a file instead of creating one. oted may want to extract the contents of the file to a specific directory. oted can do so by using the -c switch at the end of the command. For example, the following command will extract the contents of the file. tar.gz file to /tmp directory. tar -xvzf file.tar.gz -c / tmp if the file is a file compressed by bzip2, replace the "z" in the previous commands with a "j". This is the simplest possible use of the tar command, the command includes a large number of additional options, so we cannot list them all here. for more information. run the info tar command in the shell to see the detailed information page of the tar command. press the q key to leave the information page when you are finished. You can also read the online jar manual. if you are hearing a linux graphic desktop, you can also use the file compression utility or file manager included with your desktop to create or extract tar files in windows, you can extract and create .tar files with the utilityfree.
